CONTENTS

DEVELOPMENT COMES FROM RUINS, YESHUA HAMASHIAC REIGNS FOREVER

O people of Zion, who live in Jerusalem, you will weep no more. How gracious He will be when you cry for help. As soon as He hears, He will answer you. Although the Lord gives you the bread of adversity and the water of affliction, your teachers will be hidden no more; with your own eyes you will see them.

Whether you turn to the right or to the left, your ears will hear a voice behind you saying, "This is the way; walk in it." Then you will defile your idols overlaid with silver and images covered with gold; you will throw them away like a menstrual cloth and say to them, "Away with you."

VISION

By the grace of God we are the lender of last resort, Africa shall be the lender and not the borrower. DIRT Metals Commodities Global Trader a company founded under the Ministry, House of Jacob the House Of Peace Eternal (H.O.J the H.O.P.E) the custodian of the provision.

MISSION

To serve and economically empower the people of God to the glory of the most high KING of all kings Yeshua Our Christ. To balance the scales by implementation of divine strategy to the complete eradication of poverty for the Kingdom come.

Email: nyabunzen@gmail.com
REG NO: 2022 / 313822 / 07

EXECUTIVE SUMMARY

OBJECTIVES

1. To rehabilitate all viable mineral dumps in Africa availing locked up land for communal and commercial use, reducing the environmental risk ever present in these waste sites.
2. To reach at least an equivalent of USD$11 trillion (grain tonnage equivalent) in gold bullion and other strategic mineral reserves by rehabilitative operations and forward buying by April 2028: Bullion Banker (10/11/2022)
3. Implement a Revenue collector design portfolio for the Revenue Authority by legitimizing the artisanal informal mining sector (propose and negotiate tax bracket) in all African regions.
4. Legalize and legitimize the Zama-Zama business profile, assimilate it into the mining charter and contribute to the *fiscus* within all individual countries that implement the strategy proposed within this blueprint.
5. Conserve the environment by the effective rehabilitation (cleaning up) of all redundant, derelict slimes and tailings dumps jointly with the Zama-zamas providing them with skills transfer, advanced processing technology, and training programs formalizing this informal but highly profitable sector by training them on non-invasive processing operations.

Unique selling point: *DIRT Metals Commodities Global Trader has successfully mapped a strategy outlay that will build a "Modern Competitive Economy" starting from a shallow level of industrialization to be implemented in Africa with global reach.*

We have formulated a blueprint that gives governments' freedom of developing flexible policies by eliminating circumscription by international commitments and the rigors of international competition. DIRT. is set to be the largest rehabilitation incorporation in Africa. It will employ all previously existing mineral processing techniques at optimized levels achieving both economic viability and environmental sustainability in the rehabilitation programmes long-run. Over the past 100 years of gold mining by large corporations, we see a trend of increased reluctance to follow through with the set rehabilitation plans stipulated in environmental management plans. The focus has always been to maximize production outputs, drastically reducing the Life of Mine with direct proportions of waste outputs at unplanned rates.

1. UNLOCK LAND FOR AGRICULTURAL, INFRASTRUCTURAL DEVELOPMENT, AND ENERGY GENERATING POTENTIAL

A lot of land in Africa is currently underutilized due to derelict dumps and slime dams sitting under old mining rights held by big corporates who keep chasing new ventures rendering land defunct. Our objective in our plan gives assurance of robust growth in non-farm employment opportunities and cropland productivity. Our drive is to reduce the pressures on the demand for new cropland, increase energy generation potential (solar and wind), and avail infrastructural growth potential. Our train of thought is that utilization of Africa's arable land should not be limited by foreclosed or run-down activities that have ceased to contribute to the fiscus or produce any viability per unit area.

2. LEGALIZE ZAMA-ZAMA ARTISANAL MINING

What has been termed illegal mining in Africa stands as the bridge uniting mining development and economic growth within African communities endowed with mineral resources. Over the past 4 centuries mining activities have grown in scale due to international trade dynamics. These international trade dynamics have brought so many rules regulating the participation of the founders of the industry and trade. Mining was begun at subsistence scales within family groups who would trade their product for domestic needs. Needless to say that it was through these trade channels that Africa got attention regarding the continent's mineral wealth and potential. Governments have been forced to criminalize mining for subsistence in countries where most families are living on one meal a day. Most of the so-called Zama-zamas manage their households and extended families from the proceeds coming from artisanal mining by the greater population margins belonging to the lower income bracket. It is worthy to acknowledge that children are being sent to school and kept from loitering by parents that work in these termed "illegal mining areas", families are fed and protected through this artisanal sector.

Contrary to popular belief, Zama-zamas are not criminals, we agree that their working environment does provide a breeding ground for criminal activities which is not impossible to regulate and control if the focus were shifted from the Zama-zamas themselves. So many other industries also provide breeding grounds for criminal activities common to artisanal mining areas though at more controlled rates due to policing control and regulation. For almost 18 years I have worked closely with these artisanal termed, "illegal miners". The dedication and effort that these men and women put into production leave them with no time to indulge in criminal activities at all. Most of the mining techniques that they employ are very primitive requiring more effort per tonne yield compared to formal mining operations.

Commercial mining is an industry founded and rooted in panning, the two are the same only differing in technological processes and scale of operations. All the products from these illegal activities end up in the same market. The government has just been blinded to the fact that they should be collecting revenue from these miners, and building a strong gold reserve for the reserve banks instead of being scammed by private refineries who fund these illegal activities, buy the gold and platinum only to run double books within their refineries and claim Value Added Tax from the revenue authority for work they did not do, the value they did not add.

We intend to be the bridge between the informal mining activities of Zama-zamas and the formal industry, introducing a new tax-paying bracket thereby increasing a country's revenue and bringing a positive outlook to the African mining industry as a whole. African gold reserves have dwindled over the past century due to export demand thus weakening currencies and increasing reliance on the World Bank and other international monetary funders (DEBT). The strategy we intend to implement will promote environmental preservation through training and assimilation of the Zama-zamas into safer working practices, the main catch being replenishing gold reserves, strengthening the monetary systems, and reducing debt for individual countries.

In light of the shift within world economics, we plan to get ahead and empower the informal market through assimilation into the formal mineral sector as grass-root training and development programs that generate revenue for lower levels of government. The pressure is reduced by the central government and administrative transparency and accountability will formulate a strong growth structure for the economy.

3. BRIDGE FOR REVENUE DISTRIBUTION BETWEEN DIFFERENT LEVELS OF GOVERNMENT.

Implementation of fiscal decentralization in the mining sector by direct interaction with lower levels of government. The African economy will achieve balance through the granting of “fiscal autonomy”. This has worked for developed countries and improves accountability thereby mitigating corruption.

State participation in extractive industries has brought an issue of ownership. By implementing this blueprint, revenue authorities will carry the advantage of common governance of several parts of the value chain in the interest of the state. Institutional assets such as corporate culture, leadership or management diversity, privileged access to home or host markets, or benefits from having a presence in many different markets.

The central policy has always been contentious regarding mining taxation and how and what level of government- central, intermediate, or even local, should mining revenues should be appropriated or distributed. Central governments have historically been the retainers of mining revenues often with little transfer to the areas where mining occurs. This blueprint is developed to satisfy the rationale behind the distribution and use of tax revenues at the sub-national level, more so focusing on the environmental and social effects of mining. By creating a platform for that revenue to be successfully spent in terms of local development. Appropriation at the sub-national level in the mineral sector can only be achieved through a structure represented by this blueprint to encourage revenue-sharing arrangements and fiscal decentralization.

Many times attempts to direct back some mining revenues to affected areas and communities have failed due to a lack of planning capacity at a local level. By consolidating parts of the fiscal benefits from mines into minerals development funds earmarked for specific distribution purposes we find that tool has been missing in the integrated planning and distribution process for success. The strategy presented in this blueprint will serve as a think tank and present strategic plans suited to each scenario.

Since not all types of taxes are equally amenable to fiscal decentralization, we have a solution for the lower level to generate taxes by the assimilation of a non-scaled informal business sector. Zama-zamas should and will be best suited as lower-level tax bracket contributors with policies and statutes formulated to protect them and ensure that government maximizes on such a thriving industry. At the lower level, environmental strategy and implementation plans will also be viewed as income generators presenting closed circuits with gazetted financial reports and QA/QC reports presented to sub-national, national, and central-government.

Royalties, property taxes, surcharges, and various fees (nominal fees for the application and issuance of documents as well as land use fees) will become justifiably priority well suited for local distribution. Value-added taxes (VAT) will be assessed by the taxing authority that assesses VAT for other activities (National Agency), creating a healthy synergy within the Revenue Authority System. Major taxes (income taxes, import and export duties, royalties, and additional profit taxes) will remain in the central government portfolio.

We intend to be part of the solution to contentious issues arising in connection with the collection and distribution of mineral sector taxes at the sub-national level. Since the amount of mining revenue is finite, an increase in revenues set aside for the exclusive benefit of qualified parties is often matched by a loss in general revenue sharing through the regular budgeting process in instances of reduced budget allocation to social expenditure. In presenting a new player (taxpayer) to the lower level, the subsistence of the local level will ease the demand for budget allocation through self-reliance and strategic growth of the government's economic base. We, therefore, present a solution to instances when mining revenue represents an important share of total government revenue and a significant share of the revenue is appropriated locally.

Administrative boundaries of affected areas can be better mapped by lower-level portfolio administration that will be included within our design stemming from boundaries instituted by the department of mineral resources when issuing old-order mining rights and allocation by geological mapping and classification.

We know that mining revenue does not provide a steady flow of funding on a year-to-year basis because the focus always goes to medium-large scale mining operations. Artisanal to small-scale operations are very stable as their costs of production are manageable due to simple operational techniques that are more labour-intensive (primitive) than technology-savvy but with consistently high output. The proof is in how most private refineries have maintained the viability of their businesses illegally but numbers do not lie. Most have had marked growth potential by mostly informal input from Zama-Zama operations within the SADC region.

4. ADDRESS THE REDUNDANCY OF MEDIUM-LARGE SCALE GOLD MINERAL PROCESSING PLANTS IN THE REGION

The productivity of most conventional South African underground gold and platinum mines is declining, operational costs are increasing, and profit margins are shrinking, while health, safety, social, and environmental challenges are present (Neingo and Tholana, 2016; Singh, 2017). Many narrow-reef gold and platinum mines in the country are increasing in depth to reach new deposits, resulting in longer traveling times, rising costs, reduced profits, and heightened risks (Deloitte, 2014; Jacobs and Webber- Youngman, 2017; Minerals Council South Africa, 2018a; Singh, 2017).

Projects to draft frameworks to assist mines to optimize shift cycles to maximize productivity, OHS performance, and employee wellness have faced challenges in reaching their objectives because they have overlooked the mineral processing effectiveness regardless of optimizing mining shift cycles. Optimization of the current mineral processing plants has proved costly and ineffective due to a complete shift of source. The primary resource base has become unprofitable. The new resource base has shifted to a secondary source previously classified as waste. Derelict slimes dams and tailings dumps and the assimilation of intermediary material from Zama-zamas is the solution to sustaining profitability within the current infrastructural design and setups associated with most mineral processing plants more so within the medium-large scale operations.

Though projects have tried to shift into the rehabilitation of dumps using existing infrastructure but have failed to break even because of an essential missing link within the models they have designed. The Zama-Zama design model has been the missing link to breaking even into profits with the lowest costs incurred in the transition. The scales will balance with the assimilation of this model into the framework of the value chain. It is common knowledge that there has been a decline in the predominance of gold, due to economic changes and the age of gold mining, and the depth of mining to reach deposits.

5. SMALL-SCALE AND ARTISANAL MINING DEVELOPMENT

Artisanal mining often takes place under "gold rush" conditions, with thousands or even hundreds of thousands of people gathering in a small area to mine gold or precious stones. The conditions are often very primitive, with improvised housing and little in the way of organized health care. A problem specific to gold mining is the widespread use of mercury to amalgamate the gold that is panned in river beds, and the resulting serious consequences for the health of people, domestic and wildlife. The sheer magnitude of these Zama-Zama activities shows that there is a lucrative sector within the mineral processing and extractive industry that has been demonized instead of being embraced and conformed by policy infrastructure and statute implementation to safeguard the people, environment while adding immense value to the minerals sector revenue.

The revenue is currently ending up with middlemen who buy the mineral produced and infiltrate the commercial networks under second-hand gold industry licenses. The market does not differentiate gold that comes from the formal and that which comes from the informal sector, this leaves a gap that we intend to close with the implementation of this blueprint. The revenue authority has been robbed blind by refineries that have funded the illegal buying of gold and other precious metals and then run double books legitimizing (contraband) illegal products. The worst and most detrimental effect of these scrupulous activities is a multi-Billion Rand VAT scam that SARS (South African Revenue Service) is currently hard hit by.

6. LEGALIZE ILLEGAL IMMIGRANTS' INITIATIVE

This blueprint offers an opportunity to legalize immigrants that operate within the Zama-zama mineral sector. It is common knowledge that artisanal mining as a livelihood, particularly for very poor segments of the population who have little access to other sources of cash income, it also poses serious social, economic and environmental challenges. Most artisanal mining is part of the informal sector – while it is considered illegal in most countries, it is difficult to arrive at reliable estimates of the population operating within this sector. We do know that there is a high rate of illegal immigrants due to the informal environment which presents a cover for them and provides a livelihood for themselves and their families back in their home countries.

By initiating a proactive stance to mitigating the problem of undocumented foreign nationals in each country, we reduce the crime rate by creating accountability by documentation of the miners. The police system has been struggling to curb the phenomenon of artisanal mining as it is almost impossible to take food from an impoverished man's table. Taking into consideration that as long as there is value to be realised in gold rich areas there will always be activity. Instead of expending the police departments budgets on operations that yield little to no results and also give rise to tension and police resistance, we propose a way to effortlessly document all the operators within this

Email: nyabunzen@gmail.com
REG NO: 2022 / 313822 / 07

sector. A green-card system for registration of immigrants within the artisanal sector will motivate for voluntary registration of all participants including the service providers within the sector as a whole, these include grocery shops, hardware shops, catering businesses, security providers and pharmacies who all operate illegally within these areas.

Better control of contraband, drugs and other illegal products usually found in these areas will realise a safer environment for the surrounding communities. A sense of accountability within the miners themselves will encourage them to safeguard the interests of local communities and to be synergistic with the needs and requirements of each others areas of interest. This will make policing more effective in controlling crime in these areas as there will be better visibility of each and every role player within the area.

7. NEW PATH FOR BUSINESS INCENTIVE IMPROVING QUALITY OF LIFE

Developing business strategies calls for paradigm mindset change. Tomorrows leading businesses will succeed, not by battering competitors. Fresh initiative like this blueprint will create “blue oceans” of uncontested markets. The concise outlay will be seen in overall improvement of quality of life;

A. QUALITY OF LIFE

i. Gross National Income (GNI) Gross National Product (GNP): Increase in value of goods and services produced by the citizens of any individual country that implements the strategy proposed. Other countries with active participants (immigrants) will contribute to their respective fiscus by the dividend of the total population.

ii. Human Development Index (HDI): Favourable increase by growth factored in through Gross National Income per Capita. Trickle down effect to improving “life expectancy at birth” and “years of schooling”, by increased available income within the family unit.

iii. Gini Coefficient: A marginal reduction in the statistical calculation of income distribution, through the formalization of the artisanal mining sector which holds a high value in income generation within the Socio-Economic Development contributory weighting within a country. Reducing inequality within any country, increases growth potential across all sectors by boosting investor security.

Being the first to implement this blueprint will give a country strategy to lead a niche development strategy that not only reflects global leadership and incentive but also sets a new pace for advanced sustainable development at the grandest and most exhaustive level of successful carbon footprint reduction. Additionally and strategically government/State can wilfully divert index fund investment into the rehabilitation extractive sector preserving undeveloped resource potential, allowing for appreciation in unexploited potential. Increasing the value in community stakeholders reduces and justifies “discounted cash-flows”.

B. INCREASE GOVERNMENT EQUITY SHARING

Acquiring a higher stake in any profitable project and direct involvement in operations are the main motives for government participation. Successful reduction of the financial obligations of equity sharing through diverting any potential proposed investment of index funds into artisanal rehabilitation projects and negotiating higher market price by flaunting the "Green-face" aspect of the projects. This unequivocally reduces the risk previously carried government engagement in equity sharing. By increasing the share of community stakeholders through formalization of artisanal mining in rehabilitation projects controlled at lower-level safeguards the government's regulatory role.

Implementation of this blueprint will encourage specific policy changes aimed at increasing state control over participating enterprises through increased ownership. Lower level government control of these projects will perfect indigenisation programmes by retaining controlling stake of all rehabilitation projects by safeguarding the secondary resource initiative by giving control to community stakeholders. **"This is a Strategic Section of Industry that cannot be Privatised."**

Government/State may decide to block 25% of the shares of 50.1% majority shares in this niche sector of the mineral processing and extractive industry, specific policy changes will serve as guidelines to the most beneficial working agreement with foreign investors. This will gradually give greater advantage to government/State in the engagement and implementation of negotiation strategy in green-field projects compared to historical negotiations which always favoured the foreign investor.

In the case of only one investor, direct negotiations with government are obviously necessary, to stamp out any possibility of corruption and promote transparency these negotiations are to be carried out in public participation meetings. The risk for corruption is somewhat reduced by the availability of several different areas to be allocated which allows the design of a standardized framework for concessions (derelict sites). Indonesia used such frameworks successfully in the past. Where the characteristics of the area are relatively well known and where there are several potential investors, tender/auction procedures, similar to those commonly used to grant oil or natural gas concessions.

We have successfully mapped a strategy to achieve building a Modern Competitive Economy which is starting from a very low level of industrialization in Africa.

SOUTH AFRICA

1. SMALL, MEDIUM AND MICRO-ENTERPRISES (SMMES)

Small, medium and micro-enterprises (SMMEs) in their smooth running are major contributors to economic growth across socio-economic imbalances. By modelling the business plan to satisfy the aims and objectives of SMMEs expectations within the country, measurable economic growth will be achieved;

A. ECONOMIC GROWTH THROUGH SUSTAINABLE REHABILITATION IN THE MINERAL SECTOR

i. Overcoming inequalities and socio-economic imbalances

ii. Eradicate poverty

iii. Promote self sustenance within communities

iv. Youth empowerment through skills transfer and mindset change

B. SUSTAINABLE RE-USE OF RESOURCES

What has been termed waste is now a sustainable resource. Justification is through analysis of the activity of Zama-zamas in derelict mine areas. Due to socio-economic imbalances imposed and still existing in South Africa especially zooming in on the effects of the Land Act and Group Areas Act we have noted that the townships located in the urban areas are all in close proximity with derelict mines and dumps. Informal settlements have sprouted around these townships creating community hubs that require sustainable development. These are the chief beneficiaries of the community development initiatives planned by DIRT Metals Commodities Global Trader in this blueprint.

C. PROGRAMMES TO BENEFIT THROUGH IMPLEMENTATION

i. Growth, Employment and Redistribution (GEAR) initiated in 1996

ii. Reconstruction and Development Programme (RDP) initiated in 1994

iii. Accelerated shared Growth Initiative for South Africa (AsgiSA) initiated in 2006. This is an ongoing initiative which has yet to achieve it's set aim of promoting economic growth by halving unemployment and poverty.

iv. National Development Plan (NDP) initiated in 2011 to reduce inequality and rid the nation of poverty. It's aim is to improve the quality of education and skills development for all people including people in rural areas, women and youth. Target for job creation is 11 million more jobs by 2030. Environmental development, community work, and public services such as health care, education and policing. The target for poverty is to have no South Africans living below the poverty line 2030.

2. MINING CHARTER PRIMARY OBJECTIVE SUPPORT INITIATIVE

The primary objective of the Mineral and Petroleum Resources Development Act (MPRDA) is to ensure the attainment of Government's objectives, that is, to redress historical socio-economic inequalities, to ensure broad-based economic empowerment and the meaningful participation of Historically Disadvantaged Persons in the mining and minerals industry. We know from the charter that section 100 (2) (a) of the Mineral and Petroleum Resources Development Act (MPRDA) empowers the Minister to develop a Broad-based Black Economic Empowerment Charter for the South African Mining and Minerals Industry ("Mining Charter") as a regulatory instrument with specific measurable targets to effect transformation of the industry. Within the preamble we realise that comprehensive assessments since 2004 to date have shown an ineffectiveness and shortcomings with the set target objectives.

Our approach is firstly to look at the contribution made into private firms that would justify equity through forced equality and non-financial justification for apportionment of shareholding. We agree that there is a need to balance the scales as far as the systematic marginalisation that the majority South African endured through colonial rule and exclusionary policies of the apartheid Government. The solution to the redress is the deliberate empowerment of the majority within the confines of the informal sector of the industry. Give life to the broad-based black artisanal miner who is competing sustainably at a small scale within the mining industry. Embrace them by making them the primary beneficiary to the Broad-Based Black Economic Empowerment benefits. The Employment-equity, human resource development, housing and living Conditions then become the secondary benefits that can be enforced within the private sector. A re-arrangement of the target objectives by distributing them into a section of the industry which still holds the private firms liable for rehabilitation but holds **Value** evidenced by the activity of the Zama-Zama. Ownership, Beneficiation, Mine community development will be justified by the **VALUE** carried in the area that the artisanal miners work.

➢ *A rough estimate based on experience on a 5 million ton of derelict dump at 2g/t at 50% recovery and estimated 30% yield would produce: 1500kg of Gold Bullion.*

This is the trump card in the sustainable development element, which seeks to enhance sustainable transformation and growth of the mining industry. Enforced compliance will always encounter resistance especially in instances where there is limited power and control in enforcement. Even with ultimatums given on conditions to protect the "Social License to operate" whatever has been collected is still insufficient and wholly inadequate to sustainable growth or any form of empowerment to the Historically Disadvantaged Persons.

By adopting this blueprint the South African government will be able to achieve the set objectives of the Mining Charter which include;

(a) The affirmation of the internationally recognized principle of State sovereignty; it's right to exercise authority and make laws within its boundaries; over the life of its country- including all its mineral wealth;
(b) To de-racialise ownership patterns in the mining industry through redress of past imbalances and injustices;
(c) To substantially and meaningfully expand opportunities of Historically Disadvantaged Persons to enter the mining and minerals industry and to benefit from the exploitation of the nation's mineral resources;
(d) To utilise and expand the existing skills base for the empowerment of Historically Disadvantaged Persons;
(e) To advance employment and diversify the workforce to achieve competitiveness and productivity of the industry;
(f) To enhance the social and economic welfare of South Africans so as to achieve social cohesion;
(g) To promote sustainable growth and competitiveness of the mining industry;
(h) To enable growth and development of the local mining inputs sector by leveraging the procurement spend of the mining industry; and
(i) To promote beneficiation of South Africa's mineral commodities.
(j) **Sustainably rehabilitate all old mining order waste sites economically.

A. MINE COMMUNITY DEVELOPMENT

Mining rights holders are expected to contribute meaningfully towards Mine Community Development; with a bias towards mine communities both in terms of impact and size, and in keeping with the principles of the social license to operate. Though the charter mandates the Mining Rights holder to implement 100% of the Social labour Plan commitments including the budget in accordance to section 102 of the Mineral and Petroleum Resources Development Act

Email: nyabunzen@gmail.com
REG NO: 2022 / 313822 / 07

(MPRDA), we have realised that there is more benefit in channelling socio-economic proceeds from Social labour plans into measurable productivity in the artisanal sector while holding the private sector to fulfilling and play a role in the rehabilitation before CLOSURE. The balance between mining and mine community's socio-economic development is achieved by giving the community life/value through participative initiative preserving the nations pride. By bringing socio-economic development initiatives based on government expectation under this blueprint will increase (NPAT) contribution to 5%> due to measurable productivity within the community.

B. FOOD SECURITY THROUGH COMMUNITY DEVELOPMENT

Fair trade is better than aid, and only internal trade can set the foundation for fair trade. The strategy Fair trade organisation is to relieve poverty and ensure sustainable development. This is achievable by promoting agricultural practices that support the farmers and their communities, that promote a healthy environment and ensures ethical dealings with trade partners. The weakest link for Africa has been the lack of insight into what TRADE entails which has led to endless dependency on foreign aid. The original trade model for Africa was sustainable and is still the most viable model for growth and development. By building monetary reserve a community is able to trade viably and grow from the roots guaranteeing stability before branching out to further reaches in global trade. Africa is self
sustaining and needs to be re-directed to reclaim it's original blueprint. We are going to correct the EZEKIEL 17 error and the scales will balance. Africa is the trade hub of the World and the roots need to get grounded so the vine will stabilize and grow.

DIRT Metals Commodities Global Trader reserves the right to be Administrator of this blueprint and all support activities associated with it. All planning and costing shall be held in the organizations portfolio and shall be available to the stakeholders on written authorisation by the office of the Minister of Mineral Resources and office of Economic Development.

DIRT Metals Commodities Global Trader shall hold charge of the following within the value chain;

Firm infrastructure – Financing, planning, investor relations

Human Resources management – Skills transfer, compensation system, recruiting

Technology Development – Product design (Refining and Minting), testing, process design, material research, market research

Procurement – Components, machinery, advertising, services

Email: nyabunzen@gmail.com
REG NO: 2022 / 313822 / 07

ADMINISTRATIVE MODEL

1. Land claim resolution, clarity, and full disclosure on property rights, land claims, and above surface mineral rights. Discuss policy and statutes under the Department of mineral resources. Our focus is on making the competition irrelevant by giving control to the government through community ownership. We are creating a leap in product value for buyers and the participating enterprises. **The gram produced under our blueprint will hold higher value, thereby opening up new and uncontested market space.** Our value innovation is aimed at creating and capturing new "DEMAND".

2. Full disclosures by all interested and affected parties. All existing permits, old order mining right conversions and new order mining rights and licenses, statutory instruments, historical conflicts of interests, and registers of all stakeholders and shareholders. Transitional arrangements are to be fully disclosed and verified by the regulatory department.

3. Funding structure and clarity; debt with equity, interest rate IRR, or any other. Presentation of financial models and justification of contingencies and financial securities.

4. Appointments (Executive, political and legal) register with role justifications and clarity upholding the integrity of the blueprint.

5. Discuss off-take agreement options with direct input from all stakeholders and all interested and affected parties. Funders/investors are to be given an official invite to off-take agreement discussions by a vote by stakeholders.

6. The business profile (KYC)

Email: nyabunzen@gmail.com
REG NO: 2022 / 313822 / 07

OPERATING MODEL

1. Beneficiation Plan: Clean-up starts with the handling of Zama-Zama waste. This material has been stripped of most of the free gold by the artisanal miner. This material is the sweetener for the bulk of the oxidized dump bulk. Sampling and blending ratio simulations will be done during Run-Of-Ex-Mine operations to maintain BCOG (Bottom-cut-off-grade) and TCOG (Top cut-off-grade) for profitability. These simulations will be scaled at different plant through-puts and capacities.

2. Assessment of mineral processing plants to be used for elution through lab work, modelling and simulations, and scaling batch treatments for ease of handling and to maximize profitability. To reduce double handling stockpiling modelling will also be essential taking into consideration all sources per toll treatment proposal, thereby controlling against contamination. The material composition will be paramount in deciding refinery schedules for the sake of QA/QC and interim processing upgrades required within each circuit. For example the introduction of mercury catchers along the circuit at any particular phase.

3. Due to the multi-mineral processing capacity of this model, each project will be outlined with specific phases of mineral processing techniques to be employed with each beneficiation stage in the circuit. 5 phase outline for gold production will be designed with different common processing techniques and new technology. The same phased outlines will be used for the design of Platinum group metals (PGMs), Copper (Cu), Chrome(Cr), Manganese (Mn), and gold clean-up projects.

4. Labour complement will be mixed skilled and unskilled. Skills transfer will be the integral strategy of the initial project phase to ensure self sustenance within each community during (L.O.exM). The plan will have a 1:25 ratio simulating training programs providing a guarantee for long term sustainability of individual communities. We are not re-inventing the wheel, we just made it more dependable and practical.

5. Presentation of a safety, health, and risk assessment package, designed to suit each mineral of interest. Implementation of each file will fully complement the historical Environmental Management Plan (EMP) completing the rehabilitation expectations.

6. Present and implement a complimentary QA/QC management system that will umbrella the master plan. The management system is a document designed to cover all minerals within the rehabilitation scheme. The QA/QC file is the feedback system to be used as a reporting system for the overall operational framework of each project.

REG NO: 2022 / 313822 / 07

FINANCIAL MODEL

PROJECT VALUE INITIAL-GOLD SLIMES DUMPS

- Gold slimes dump beneficiation – USD 7.2 million per annum. [Estimated duration of the project (L.O.xM)] ~ 15 years]
- On completion- USD 108 million
- Value is based on one plant installed with a production profile of 5000t @ 6gpt and USD 38 000/kg Au
- Plant recovery – 55% average

The model is based on a minimum input grade of 1gpt for the tailings. The yield ratio will be 5:1. To produce 5000t for processing the spiral plant need to process 25 000 tons of dump material. This can change dramatically when the grade increases. The yield will also depend on the planned cut-off grade that is acceptable for the processing plant. The model also looks at an in-one cost structure and a profit split after all costs have been deducted.

SITE ESTABLISHMENT COST

ITEM	RATE	QUANTITY	TOTAL
Yellow Equipment	$600.00	25	$15,000.00
Working Capital	$30,450.00	1	$30,450.00
Concrete	$100.00	100	$10,000.00
Dam Lining	$8,500.00	1	$8,500.00
$63,950.00			

CAPITAL REQUIREMENT

Capital Equipment

ITEM	COST
Spiral Plant (20tph)	$150,000.00
Pumps	$15,000.00
Screen	$45,000.00
Piping	$8,000.00
Conveyor belts	$15,000.00
Feed bins	$8,000.00
Electrical Panel	$6,000.00
Cyclones	$10,000.00
Security lights	$5,000.00
Cabling	$9,000.00
TOTAL Project Phase 1 CAPEX	**$271,000.00**
Plus 8% cost overrun facility	**$361,746.00**

PROJECT SCOPE

PHASE 1~ SPIRAL PLANT

The project entails the erection of spiral plants to process the waste material that contains the lower grade commodity that was discarded as waste during the Life Of Ex-Mine (L.O.xM). This low-grade material with a bottom-cut-off-grade of 0.7g/t and a top-cut-off-grade of +2g/t -2.8g/t. The water management system for this phase will operate in a closed circuit with a reservoir (settling vessel). The gravity separation technique in this process will ensure the removal of light silica and organics to be neutralized for civil engineering and agricultural use, back-filling, brick-making, and gardening pads (greenhouses).

The corporate social responsibility (CSR) portfolio will dedicate community development through training of the unskilled populace and integration of the Zama zamas into the formal sector of industry. The heavy material is further classified by a 2-stage cyclone system; cluster cyclones where further classification takes place and a dewatering cyclone. A sampling of both streams will be

REG NO: 2022 / 313822 / 07

employed to monitor classification and track elemental spikes or new minerals within batches.
The spiral plants are a modular design that allows the increase in production of a specific plant without interfering with the current installation or production profile. The modular design also accommodates batch treatment giving the flexibility to start and stop complex materials with low down times. The production profile is sized at 20tph with an expansion capacity of up to 100tph viable modular design. The plant is mobile by design allowing for efficient cost management. The setup lead time is set at 6 weeks, and relocation takes the water management system and civil works into account.

PHASE 2 ~CRUSHER PLANT

There will be a hand-picking exercise to be done on the oversize material dumped with over-burden material (Ex-Mine oversize) for high-grade lumps. Basic Geological skills will be transferred during this exercise introducing the lame-man to mineralogical appreciation thereby encouraging pursuits in educational enrichment. This will always be a community-based exercise whereby the local mature women (widows and orphans) and other unskilled +25-45years females will be trained to be spotters and pickers of high-grade oversize material. A pay scale will be negotiated and presented to the investor and the cost will be covered in the contingency. This material will be stockpiled together with other sweeteners collected from surrounding Zama-Zama sites.

A crushing plant will be introduced as an independent circuit with its cost model. The crushing plant consists of feed conveyors, a primary crusher, and vibrator screens. Secondary crusher and final product bins. The crushing circuit is a closed loop circuit and recycles the oversize material either back to the primary crusher or the secondary crusher. The final product will be stored in a surge bin that will feed the milling plant via a speed-controlled feeder.

COST MODEL

SITE ESTABLISHMENT

ITEM	RATE	QUANTITY	TOTAL
Yellow Equipment	$600.00	15	$9,000.00
Working Capital	$29,250.00	1	$29,250.00
Concrete	$100.00	150	$15,000.00
Civil Excavations	$4,500.00	3	$13,500.00
$66,750.00			

CRUSHER CAPITAL COST

ITEM	COST
Jaw crusher (primary) (60tph)	$50,000.00
Cone crusher (secondary) (40tph)	$35,000.00
Primary Screen	$35,000.00
Secondary Screen	$18,000.00
Conveyor belts	$55,000.00
Feed bins	$18.000.00
Electrical Panel	$8,000.00
Surge bins	$12,000.00
Security lights	$5,000.00
Cabling	$9,000.00
Total Project Phase 2 CAPEX	**$255,000.00**
Plus 8% cost overrun facility	**$347,490.00**

PHASE 3~ MILLING AND LEACHING

MILLING PLANT

ITEM	COST
Plant CAPEX + working capital	$296,987.17
Monthly OPEX by 3 months	$98,961.51
Plant OPEX	$115,096.21
Contingency	15%
Total Project Phase 3 CAPEX/OPEX	**$511,044.89**
Total	**$587,701.62**

**Depending on the planned bullion output, the mill sizing may be reviewed upwards by increasing

REG NO: 2022 / 313822 / 07

the number of units that will be operating in parallel within the circuit to increase capacity but maintaining the work done per unit particle achieving +85% passing 50 microns.

The option of engaging larger processing plants will vary the phase 3 project CAPEX inputs basing the financial model on the plants cost per tonne and the logistics node of hauling to plant cost per tonne taking into consideration insurances. The toll processing cost negotiations will give a final outlay of the expected figure taking standard constants of: Working capital approximated to 10% capital cost, Metal sale value- USD$/gram, Power generation- USD$/litre of diesel, cost per ton- USD$/ton. An 8% contingency will be calculated and allocated for project flexibility and unforeseeable costs.

PROJECT VALUE- CHROME ROM DUMPS (27%)

• Chrome ROM Dumps beneficiation- USD$10.2 million per annum Estimated (L.O.xM) 15 years. •

On completion- USD$153 million

• Calculations based on one plant installed with a capacity of 10 000tpm @ 42/44% and USD$85/ton

The model is based on a minimum input grade of 27% for the tailings. The yield ratio will be 3:1. To produce 5000 tons for processing the spiral plant needs to process 15 000 tons. This can vary significantly with grade spike increases. The yield will also depend on the planned bottom cut-off grade that is acceptable for the market. The model also looks at an all-in cost structure and profit split after all costs have been deducted.

SITE ESTABLISHMENT

ITEM	RATE	QTY	COST
Yellow Equipment	$600.00	25	$15,000.00
Labour	$9,000.00	1	$9,000.00
Concrete	$100.00	100	$10,000.00
Dam Lining	$8,500.00	1	$8,000.00
TOTAL		**$42,500.00**

CAPITAL REQUIREMENT

CAPITAL EQUIPMENT

ITEM	COST
Spiral Plant (100tph)	$150,000.00
Pumps	$15,000.00
Screen	$45,000.00
Piping	$8,000.00
Conveyor belts	$15,000.00
Feed bins	$8,000.00
Electrical Panel	$6,000.00
Cyclones	$10,000.00
Security lights	$5,000.00
Cabling	$9,000.00
TOTAL Project Phase 1 CAPEX	**$271,000.00**
Plus 8% cost overrun facility	**$338,580.00**

FUNDING REQUIREMENT

The project is partially funded. The options available are;

i. Combination of debt and equity

ii. Debt with no equity

iii. Equity no debt

The investor will be required to fund the purchase of the capital equipment and site establishment plus the overrun contingency allocated for phase 1 of the project.
